

High School Students Built HKUST's Patented Hi-NW Light Disinfection Devices to Benefit the Community

A HKUST Engineering STEAM education initiative utilizing the patented Hi-NW light-based disinfection technology developed by Prof. King Lun YEUNG has contributed in assisting the community to fight COVID-19, in addition to nurturing curiosity and creativity in our future engineering talents by providing them with hands-on learning experience.

"I am grateful to Lee Hysan Foundation for making this happen. For the students, I congratulate you for achieving this finally, as it has not been an easy year adapting to the pandemic situation. I hope that you will pass the baton to the younger students in your school – not just about the technology and skills you have learned, but also the essence of contributing to the community." said Prof. King Lun YEUNG
